<td><strong>INTRODUCTION</strong>&lt;br&gt;The Standards for Mathematical Practice describe varieties of expertise that mathematics educators at all levels should seek to develop in their students. These practices rest on important &quot;processes and proficiencies&quot; with longstanding importance in mathematics education. The first of these are the NCTM process standards of problem solving, reasoning and proof, communication, representation, and connections. The second are the strands of mathematical proficiency specified in the National Research Council's report <em>Adding It Up</em>: adaptive reasoning, strategic competence, conceptual understanding (comprehension of mathematical concepts, operations and relations), procedural fluency (skill in carrying out procedures flexibly, accurately, efficiently and appropriately), and productive disposition (habitual inclination to see mathematics as sensible, useful, and worthwhile, coupled with a belief in diligence and one’s own efficacy).</td>
<td>Carnegie Learning believes the teacher’s role is critical in the development of students’ proficiency across all standards for mathematical practice.&lt;br&gt;&lt;br&gt;As a facilitator, the teacher is responsible to create daily opportunities and establish norms that allow students to develop mathematical understanding from prior knowledge, build connections, and foster each student’s accountability to think, reason, and explain. Expertise is a long-term goal and students must be shown how to apply these practices to new content throughout their high school career.&lt;br&gt;&lt;br&gt;Each lesson provides opportunities for students to think, reason, and communicate their mathematical understanding. However, it is the responsibility of the teacher to recognize these opportunities and incorporate these practices into their daily rituals.&lt;br&gt;&lt;br&gt;We believe that effective communication and collaboration are essential skills of the successful learner. It is through dialogue and discussion of different strategies that students become knowledgeable, independent learners.</td>
<td>Carnegie Learning’s pedagogical approach focuses on how students think, learn, and apply new knowledge in mathematics. This approach is consistent with the Common Core State Standards for Mathematical Practice. Each practice is developed throughout each course through a combination of instructional design and teacher implementation.&lt;br&gt;&lt;br&gt;The citations below are single instances of how we develop each mathematical practice. But, they are by no means the only instances.</td>

### 1. Make sense of problems and persevere in solving them.

Mathematically proficient students start by explaining to themselves the meaning of a problem and looking for entry points to its solution. They analyze givens, constraints, relationships, and goals. They make conjectures about the form and meaning of the solution and plan a solution pathway rather than simply jumping into a solution attempt. They consider analogous problems, and try special cases and simpler forms of the original problem in order to gain insight into its solution. Older students might, depending on the context of the problem, transform algebraic expressions or change the viewing window on their graphing calculator to get the information they need. Mathematically proficient students can explain correspondences between equations, verbal descriptions, tables, and graphs or draw diagrams of important features and relationships, graph data, and search for regularity or trends. Younger students might rely on using concrete objects or pictures to help conceptualize and solve a problem. Mathematically proficient students check their answers to problems using a different method, and they continually ask themselves, “Does this make sense?” They can understand the approaches of others to solving complex problems and identify correspondences between different approaches.

Carnegie Learning believes that our implementation model (discuss, think, pair, share) provides a classroom environment for students to make sense of problems, develop strategies, persevere in implementing the strategy, and analyze the results.

At the beginning of each lesson, teachers are encouraged to engage in a class discussion to ensure that all students understand the problem presented and help students look for entry points to its solution.

As students work collaboratively through problems, they plan and execute a solution strategy. It is the responsibility of each member of the group to monitor and evaluate the progress of the group and make suggestions for changing course, if necessary. As a facilitator, the teacher moves from group to group monitoring student work, assessing progress, and redirecting with guided questions.

To bring closure and provide a summary for each problem, it is the intent that teachers ask thought-provoking questions that require students to explain their thinking and process. Multiple groups present their solutions and the class discussion centers around the use of alternate solution paths, connections to prior concepts, and generalization.

---

**IN A1 1.1 Page 2**

The Mathematical Representation page describes in detail Carnegie Learning’s overarching philosophy as students solve problems and work with multiple representations of mathematical ideas. This sequence of icons appears consistently in every lesson throughout each course.

Through the process of:
- Discuss to Understand
- Think for Yourself
- Work with Your Partner
- Work with Your Group
- Share with the Class

Students will develop the capacity to make sense of problems and persevere in solving them.
## 2. Reason abstractly and quantitatively.

Mathematically proficient students make sense of quantities and their relationships in problem situations. They bring two complementary abilities to bear on problems involving quantitative relationships: the ability to *decontextualize*—to abstract a given situation and represent it symbolically and manipulate the representing symbols as if they have a life of their own, without necessarily attending to their referents—and the ability to *contextualize*, to pause as needed during the manipulation process in order to probe into the referents for the symbols involved. Quantitative reasoning entails habits of creating a coherent representation of the problem at hand; considering the units involved; attending to the meaning of quantities, not just how to compute them; and knowing and flexibly using different properties of operations and objects.

The scenarios within each lesson help students recognize and understand that the quantitative relationships seen in the real world are no different than the quantitative relationships in mathematics. Some problems begin with a real-world context to remind students that the quantitative relationships they already use can be formalized mathematically. Other problems will use real-world situations as an application of mathematical concepts.

### IN A1 1.1

In Problem 1, students make use of their intuitive understanding of the relationship between two quantities to answer questions and build to symbolic and graphical representations. Students begin to develop a broader understanding of function that will be reinforced throughout the text. Students are introduced to formal terminology for domain, range, and function. In questions 9-10 students answer questions using the model and are confronted informally with the difference between the algebraic domain and range and the contextual domain and range.
3. Construct viable arguments and critique the reasoning of others.

Mathematically proficient students understand and use stated assumptions, definitions, and previously established results in constructing arguments. They make conjectures and build a logical progression of statements to explore the truth of their conjectures. They are able to analyze situations by breaking them into cases, and can recognize and use counterexamples. They justify their conclusions, communicate them to others, and respond to the arguments of others. They reason inductively about data, making plausible arguments that take into account the context from which the data arose. Mathematically proficient students are also able to compare the effectiveness of two plausible arguments, distinguish correct logic or reasoning from that which is flawed, and—if there is a flaw in an argument—explain what it is. Elementary students can construct arguments using concrete referents such as objects, drawings, diagrams, and actions. Such arguments can make sense and be correct, even though they are not generalized or made formal until later grades. Later, students learn to determine domains to which an argument applies. Students at all grades can listen or read the arguments of others, decide whether they make sense, and ask useful questions to clarify or improve the arguments.

Carnegie Learning believes in a student-centered classroom, as opposed to one that is teacher-directed. In this type of classroom environment students are active participants in their learning; they are doing the work, presenting solutions, and critiquing each other. The teacher’s role is to facilitate the discussion and highlight important connections, strategies, and conclusions. Often students only focus or mentally engage with a problem when they’re required to produce a “product” or “answer.” Carnegie Learning believes that the process is more important than the end result. The over-arching questioning strategy throughout the text is to promote analysis and higher order thinking skills beyond simple “yes” or “no” responses. By explaining problem-solving steps or the rationale for a solution, students will internalize the processes and reasoning behind the mathematics.

Each lesson ends with the statement “Be prepared to share your answers with the class.” Students are expected to be able to communicate their reasoning and critique the explanation of others.
### 4. Model with mathematics.
Mathematically proficient students can apply the mathematics they know to solve problems arising in everyday life, society, and the workplace. In early grades, this might be as simple as writing an addition equation to describe a situation. In middle grades, a student might apply proportional reasoning to plan a school event or analyze a problem in the community. By high school, a student might use geometry to solve a design problem or use a function to describe how one quantity of interest depends on another. Mathematically proficient students who can apply what they know are comfortable making assumptions and approximations to simplify a complicated situation, realizing that these may need revision later. They are able to identify important quantities in a practical situation and map their relationships using such tools as diagrams, two-way tables, graphs, flowcharts and formulas. They can analyze those relationships mathematically to draw conclusions. They routinely interpret their mathematical results in the context of the situation and reflect on whether the results make sense, possibly improving the model if it has not served its purpose.

<table>
<thead>
<tr>
<th>Throughout lessons, students create and use multiple representations (tables, graphs, symbolic statements, and words) to organize, record, and communicate mathematical ideas.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inherent in a collaborative classroom, students develop solutions in their group that leverage various models. As part of the classroom discussion, students may have to revise or update their group's model and solution with a more appropriate, efficient, or correct model or solution. The consumable textbook provides a record of the final solution, including appropriate models and reasoning.</td>
</tr>
<tr>
<td><strong>IN A1 1.1</strong> Students model four different scenarios using tables, graphs, and equations. Within their groups, students agree upon appropriate models and improve upon or revise models as necessary. At the end of the lesson, students complete a table summarizing the advantages and disadvantages of each representation.</td>
</tr>
<tr>
<td>5. Use appropriate tools strategically.</td>
</tr>
</tbody>
</table>

| IN A1 1.3 | Students use graphing calculators to create the graph of a quadratic function modeling the relationship between the time and height of an object dropped. |

| IN A1 4.5-4.6 | Students use graphing calculators to determine the equation of the line of best fit for data sets. |
### 6. Attend to precision.

Mathematically proficient students try to communicate precisely with others. They try to use clear definitions in discussion with others and in their own reasoning. They state the meaning of the symbols they choose, including using the equal sign consistently and appropriately. They are careful about specifying units of measure, and labeling axes to clarify the correspondence with quantities in a problem. They calculate accurately and efficiently, express numerical answers with a degree of precision appropriate for the problem context. In the elementary grades, students give carefully formulated explanations to each other. By the time they reach high school they have learned to examine claims and make explicit use of definitions.

Carnegie Learning’s intentions are that students communicate with precision when writing in their consumable books and sharing their solutions and methods with their peers. It is our expectation that students label units of measure, explain their reasoning throughout using definitions and appropriate mathematical language. However, it is the responsibility of the teacher to ensure that this intent is enforced. The answers provided in the Teacher’s Implementation Guide are exemplars of student responses and model precision appropriately. A Vocabulary section is included in the Skills Practice for each lesson that provides additional opportunity to use language and terminology appropriately.

<td>Carnegie Learning has the expectation that students communicate precisely in all lessons. The teacher materials for every lesson contain exemplar responses. It is the responsibility of the teacher to enforce the habit of using terminology, symbols, and units appropriately.</td>
</tr>
</tbody>
</table>

### 7. Look for and make use of structure.

Mathematically proficient students look closely to discern a pattern or structure. Young students, for example, might notice that three and seven more is the same amount as seven and three more, or they may sort a collection of shapes according to how many sides the shapes have. Later, students will see $7 \times 8$ equals the well remembered $7 \times 5 + 7 \times 3$, in preparation for learning about the distributive property. In the expression $2x + 9x + 14$, older students can see the $14$ as $2 \times 7$ and the $9$ as $2 + 7$. They recognize the significance of an existing line in a geometric figure and can use the strategy of drawing an auxiliary line for solving problems. They also can step back for an overview and shift perspective. They can see complicated things, such as some algebraic expressions, as single objects or as being composed of several objects. For example, they can see $5 – 3(x – y)$ as $5$ minus a positive number times a square and use that to realize that its value cannot be more than $5$ for any real numbers $x$ and $y$.

Carnegie Learning’s instructional materials focus on building a strong conceptual understanding of topics as opposed to memorization of facts. This understanding will lead to greater transfer and ability to solve non-routine problems.

Throughout lessons students must be able to recognize numeric, geometric, and algebraic patterns. Students are also required to describe patterns verbally and symbolically.

Students are reminded of their prior knowledge about the world and mathematical knowledge in developing new mathematical understanding. Take Note callout boxes in the text remind students of prior information.

### 8. Look for and express regularity in repeated reasoning.

Mathematically proficient students notice if calculations are repeated, and look both for general methods and for shortcuts. Upper elementary students might notice when dividing 25 by 11 that they are repeating the same calculations over and over again, and conclude they have a repeating decimal. By paying attention to the calculation of slope as they repeatedly check whether points are on the line through (1, 2) with slope 3, middle school students might abstract the equation \((y – 2)/(x – 1) = 3\). Noticing the regularity in the way terms cancel when expanding \((x – 1)(x + 1)\), \((x – 1)(x^2 + x + 1)\), and \((x – 1)(x^3 + x + x + 1)\) might lead them to the general formula for the sum of a geometric series. As they work to solve a problem, mathematically proficient students maintain oversight of the process, while attending to the details. They continually evaluate the reasonableness of their intermediate results.

Through interactions with Carnegie Learning materials, students are expected to make observations, develop generalizations, and write formulas.

Through classroom discourse, with in-depth accountable talk, and two-way interactions, whether among members of the whole class or small groups, teachers should stress the importance of attention to detail and the value of checking the reasonableness of solutions, both algebraically and in terms of a problem situation.

The teacher’s role is to facilitate classroom discussion and highlight important connections, efficient strategies, and conclusions.

### IN A1 10.8

Students use Gauss’ method to calculate the sum of terms of an arithmetic sequence. Students then generalize to formally state the formula for an arithmetic series with \(n\) terms.
